```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

*NOTE: This is a 'working draft' sequence. It currently
consists of 5 contigs. The true order of the pieces
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as
runs of N, but the exact sizes of the gaps are unknown.

This record will be updated with the finished sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                * NOTE: Estimated insert size may differ from sequence length

NOTE: This is a 'working draft' sequence. It currently consists of 12 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.

This record will be updated with the finished sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      as soon as it is available and the accession number will be preserved.

On Jan 26, 2002 this sequence version replaced gi:18201765.
This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (1.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AC090489
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    assembly was confirmed by restriction digest.

NOTE: This is a 'working draft' sequence. It currently consists of 47 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence is mapped to the human chromosome 12q15 region. It is overexpressed in tumours. Antagonists, antibodies and antisense nucleotides to Zsig9 are useful for detecting and treating tumours. The antagonist may be an antibody or receptor to Zsig9 and it may be radiolabelled or fused to a polypeptide toxin. It can be used for down regulating the overexpression of Zsig9. The gene sequence can be used as nucleic acid probes to detect RNA encoding Zsig9. The Zsig9 sequence facilitates improved diagnostic and therapeutic techniques for detecting and treating cancers, especially of the brain, liver, stomach, lymphoma, etc., at an early stage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 806 BP; 229 A; 183 C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; Page 33-35; 45pp; English.

variant (see AAW88474). zsig9 (see also AAW88469) is overexpressed in thuman brain, liver, lung, oesophageal, stomach, colon, rectal, thyroid and lymphoma tumors. Thus, Zsig can be used as an indicator for cancer. Zsig9 cDNA was discovered in a placenta clone from a full-term pregnancy cDNA library which contained an expressed sequence tag (see AAX06971). The invention provides colone tag sequence tag (see AAX06971). The invention provides colone trom it can be used as an indicator of the zsig9 polypeptides (see AAX069671) and the processed forms, the zsig9 gene, or probes derived from it, can be used to determine if Zsig9 gene, or probes derived from it, can be used to determine the zsig9 gene, or probes derived zsig9 can be used as diagnostic agents to determine the presence of zsig9 can be used as diagnostic agents to determine the presence of zsig9, and thus the presence of cancer. They can also be labelled with radioisotopes or fused with toxins and used to treat tumours which overexpress zsig9. Antisense nucleotides derived from zsig9 cDNA can also be used to enhance the growth or development of the proteins can be used to enhance the growth or development of the

The cDNA was isolated from a human stomach cancer cell line cDNA library. The protein has no homology with any known protein. The protein may be used to raise specific antibodies, as assay reagents, as diagnostic tissue markers, for the isolation of cognate receptors, ligands and binding proteins, and as biologically active agents. Nucleotides encoding the protein may be used as primers and probes or antisense molecules, and in gene therapy. Cells transformed with these nucleotides may be used to screen for agonists and antagonists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Kato

The invention relates to modulators of a cancer-related genes. Also classribed are: (1) processes for identifying an anti-neoplastic agents comprising contacting a cell exhibiting neoplastic activity with a compound first identified as a cancer related gene modulator, and detecting a decrease in the neoplastic activity. (2) a process for determining the cancerous state of a cell by determining an increase in the level of expression of at least one gene, where an elevated expression relative to a known non-cancerous cell indicates a cancerous state or potentially cancerous state. The anti-neoplastic agent is state or potentially cancerous state. The anti-neoplastic agent is useful for treating cancer or for protecting an animal against cancer. The immunogenic composition is also useful for treating cancer in an animal, where the composition elicits the production of cytotoxic Tlymphocytes specific for the immunogenic composition. Preferably, the animal is a human. The cancer-linked genes and polypeptides are also useful as targets for cancer therapy or chemotherapy. The present sequence represents a cancer-linked gene located on chromosome 12, which encodes transmembrane protein 4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          11-0CT-2000;

The method comprises inoculating an animal with a vector expressing a fusion protein having an antigen protein fused to the C-terminal side (extracellular) of a transmembrane domain protein (the N-terminal side of which is intracellular), and then isolating and purifying the antibody from the animal. The antibodies can be used as drugs, vaccines, diagnostic reagents and laboratory reagents. The present sequence encodes a polypeptide, designated HP10390, which we used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

                                                                                                                                                                                                                       and for treating ovarian cancer in a patient. An antigen presenting cell that expresses the sequences is useful for treating ovarian cancer by incubating CD4+ and/or CD8+ T cells isolated from a patient. The T cells can then be proliferated and administered to the patient to inhibit the development of cancer. The DNA sequences are useful as probes or primers for nucleic acid hybridisation, to direct expression of a polypeptide in appropriate host cells. Detecting the presence of a cancer in a patient involves obtaining a biological sample from the patient, contacting the biological sample with an agent that binds to the protein, detecting the amount of protein that binds to the agent, comparing the presence of cancer. Sequences ABK09464-ABK09802 represent PCR primers and CDNA molecules encoding ovarian tumour proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       13-JUN-2000;

                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated polynucleotide encoding a polypeptide comprising a portion of an ovarian tumour protein. The sequences of the invention are useful for stimulating an immune response and for treating ovarian cancer in a particular and immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; Page 253-254;

Pathological conditions can be also diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, developmental abnormalities and foetal deficiencies, autoimmune diseases, lymphomas, Alzheimer's and cognitive disorders, schlzophrenia, immunological disorders, immune deficiency diseases. (AIDS), mood disorders, respiratory disorders, arthritis, asthma, chaematopoletic disorders, respiratory disorders, arthritis, asthma, chaematopoletic disorders, cardiovascular disorders, endocrine disorders or gastrointestinal disorders. The polypeptides are also useful for identifying their binding partners. The present sequence represents a gene encoding a human secreted protein (see descriptor line for gene

The secreted protein gene sequences are deposited with the ATCC under deposit number ATCC 209118. Host cells comprising recombinant vectors containing the nucleic acid sequences are used for the recombinant production of the secreted proteins. The polynucleotide and amino acid sequences are useful

CC PRO polypeptides, to link bioactive molecules to detect other companies of the propertides, to link bioactive molecules to cells expressing CC PRO polypeptides, to modulate biological activities of cells expressing CC PRO polypeptides, and to detect the presence of mammalian lung, colon, CC breast, prostate, rectal, cervical or liver tumours by comparing PRO CC polypeptide expression in a cell sample to that in a control sample. CC Some of the 275 sequences are also useful to stimulate the release of CC proliferation or differentiation of chondrocytes, the proliferation or correct cells, the release of proliferation or differentiation of chondrocytes, the proliferation of cromparing procession in pericyte cells, the release of proteoglycans from CC of Tlymphocytes, the release of a cytokine from peripheral blood CC monocytes (PBMCs), or the proliferation of endothelial cells corrected (PBMCs) or the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by CC skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide CC to factor VIIA. The PRO polypeptides can be used in assays to identify CC molecules involved in binding interactions. The polynocleotides encoding CC PRO polypeptides can be used to assays to identify CC molecules can be used to generate probes, antisense RNA,DNA, CC transgenic or knock cut animals and can be used to generate RNA,DNA,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                              AAX97813-X97906 represent extended cDNA's which encode novel human secreted proteins (see AAY36129-Y3622) and which have cytostatic, thrombotic and osteopathic activity. The extended cDNAs can be used express secreted proteins or parts of them or to obtain antibodies capable of binding to the secreted proteins. They may also be used diagnostic, forensic, gene therapy and chromosome mapping procedures Uses also include design of expression vectors and secretion vectors

                                                                                                                                                                                                                                                                                                                                                   AAX97813-X97906 represent extended cDNA's which encode novel human secreted proteins (see AAY36129-Y36222) and which have cytostatic, thrombotic and osteopathic activity. The extended cDNAs can be used to express secreted proteins or parts of them or to obtain antibodies capable of binding to the secreted proteins. They may also be used in diagnostic, forensic, gene therapy and chromosome mapping procedures. Uses also include design of expression vectors and secretion vectors.

The present invention relates to the isolation of novel cDNA sequences which encode human secreted proteins. The cDNA sequences have been derived from a variety of human tissues. The invention also provides a method for producing proteins from these polynucleotide sequences. The proteins are useful for identifying compounds that modulate their activity and production. The sequences of the invention are useful for treating diseases such as hyperproliferative disorders (e.g. cancer), immune deficiency disorders (e.g. severe combined immunodeficiency (SCID)), autoimmune disorders (e.g. multiple scherosis), blood disorders (e.g. thrombocytopaenia), inflammatory disorders (e.g. arthritis), infectious disorders (e.g. hepatitis), allergic conditions (e.g. asthma), neurodegenerative disorders (e.g. Alzheimer's disease), liver fibrosis, coagulation disorders (e.g. hemophilia), and tumours. The polynucleotide sequences of the invention are also useful in gene therapy. ABK35610-ABK36232 represent the cDNA sequences of the invention that encode for novel human contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Jacobs K,

                                                                                                                                                                                                                                                                                                                                                                        This cDNA clone encodes novel mouse secretory peptide-9, or 2sig9 (see AAW88476), an orthologue of novel human 2sig9 (see AAW88469). Human 2sig9 is overexpressed in a number of tumours including brain, liver, lung, oesophageal, stomach, colon, rectal, thyroid and lymphoma tumors, and thus can be used as an indicator for cancer. The invention provides polyncleotides (see AAX0698-70) cencoding 2sig9 polypeptides (see AAW88469-77) including mature polypeptides, other processed forms, variants and the mouse orthologues. The 2sig9 gene, or probes derived from it, can be used to determine if Zsig9 is present on chromosome 10, and if a mutation has occurred. Antibodies raised against 2sig9 can be used to determine if Zsig9 is present on chromosome 10, and if a radioisotopes or fused with toxins and used to treat tumours thus the presence of cancer. They can also be labelled with radioisotopes or fused with toxins and used to treat tumours which overexpress 2sig9. Antisense nucleotides derived from 2sig9 proteins can be used to enhance the growth or development of the placenta, heart or liver.
